Dr. KHALIL  
Exam II  
Fall 2009

Last Name : ...........................................................  ID: .................................................

First Name: ...........................................................  Form - I

EXAMINATION INSTRUCTIONS

* Do not turn this page until asked to do so.
* Exam time is 75 minutes.
* Put the answers on the same question sheet, do not use any additional papers, even for scratch.
* Write your name, ID, section no. in the indicated places.
* Read the exam instructions.
* Read the honesty policy.
* Sign the following statement.

Academic Integrity Policy
Cheating in Exams is a violation of the Academic Integrity policy of AUC. Whispering, talking, looking at someone else’s paper, or copying from any source is considered cheating. Any one who does any of these actions or her/his answers indicates that she/he did any of them, will receive a punishment ranging from zero in this exam to failing the course. If repeated, it may lead to dismissal from AUC.

I have read the honesty policy and exam instructions and I am presenting this exam as entirely my effort.

Question 1 (25 points)
Show the output of each of the following program segments:

```cpp
const int ten = 10;
int d;
int n = 57089;
do
{    d = n % ten;
    cout << d;
    n /= ten;
} while (n != 0);
```

```cpp
int x = 1, y = 2;
while (x < 3)
    y /= x++;
cout << "x = " << setw(3) << x << "  " << "y = " << setw(3) << y << endl;
```

```cpp
#include <iostream>
#include <iomanip>
using namespace std;

void main()
{
    int a = 5, b = 7, c = 3, t;
do
    {
        if ( b > a)
            { t = a;
                a = b;
                b = t; }
        if ( c > b )
            { t = b;
                b = c;
                c = t; }
    } while (( b > a ) || ( c > b ));
cout << "a = " << setw(3) << a << endl;
cout << "b = " << setw(3) << b << endl;
cout << "c = " << setw(3) << c << endl;
}
```

```cpp
int x = 1, y = 1;
while (x < 4)
    { y *= x++;
cout << "x = " << setw(3) << x << "  " << "y = " << setw(3) << y << endl;
}
```

```cpp
int F[6] = {1, 1};
const int zero = 0;
const int one = 1;
cout << setw(3) << zero << setw(3) << F[0] << endl;
cout << setw(3) << one << setw(3) << F[1] << endl;
for (int k = 2; k < 6; k++)
    { F[k] = F[k-1] + F[k-2];
cout << setw(3) << k << setw(3) << F[k] << endl;
    }
```
A Prime number is a positive integer number greater than 1 which is only divisible by itself (and eventually by 1). The first prime number is 2, and the next is 3, and so on. The following C++ program takes a positive integer number greater than 1 and less than 100 and prompts the user whether the entered number is prime or nonprime. There are some missings (represented by dots) in the given program. Complete these missings such that the program could be compiled and run correctly. The program does not accept any integer number outside the given range (greater than 1 and less than 100).

The Program

```cpp
#include <iostream>
#include <iomanip>
using namespace std;

void main()
{
    int num, c;
    bool prime;
    do
    {
        cout << "Enter a positive integer greater than 1 and less than 100: " << endl;
        cin >> num;
    } while (..............................);
    .....................;
    .....................;
    while (..............................)
    {
        if (..................)
            ......................;
        else
            ......................;
    
    if (......................)
        cout << "The number " << setw(4) << num << "is Prime" << endl;
    else
        cout << "The number " << setw(4) << num << "is Nonprime" << endl;
}
**Question 3 (20 points)**

Write a program that uses *nested loops* to produce the following output:

<table>
<thead>
<tr>
<th>1</th>
<th>1</th>
<th>1</th>
<th>1</th>
<th>1</th>
<th>1</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

---

**Question 4 (10 points)**

1. Rewrite the Boolean expression eliminating the not operator.

   \[ !((x \leq 5) || (s > 9)) \]

2. What is the value of the following expressions:

   \[ (x - 5 != 5) && (x - 5 == 5) \]

   \[ ! (1 == 1) \]

   \[ (x - 5 != 5) || (x - 5 == 5) \]
Question 5 (25 points)
A Perfect integer number is a positive integer number where the sum of its factors (including 1) is equal to the number itself (for example, 6 is the first perfect number because \(1 + 2 + 3 = 6\)).

The next perfect number is 28 because \(28 = 1 + 2 + 4 + 7 + 14\) where 1, 2, 4, 7, 14 are the factors of 28. Write a C++ program to print out all the perfect integer numbers in the range 1 to 1000.

The Program

Good Luck
