EXAMINATION INSTRUCTIONS

* Do not turn this page until asked to do so.
* Exam time is 50 minutes.
* Put the answers on the same question sheet, do not use any additional papers, even for scratch.
* Write your name, ID, section no. in the indicated places.
* Read the exam instructions.
* Read the honesty policy.
* Sign the following statement.

**Academic Integrity Policy**

Cheating in Exams is a violation of the Academic Integrity policy of AUC. Whispering, talking, looking at someone else’s paper, or copying from any source is considered cheating. Any one who does any of these actions or her/his answers indicates that she/he did any of them, will receive a punishment ranging from zero in this exam to failing the course. If repeated, it may lead to dismissal from AUC.

I have read the honesty policy and exam instructions and I am presenting this exam as entirely my effort.

**Question 1 (10 points)**

1. Rewrite the Boolean expression eliminating the not operator.

   \(! ( ( x <= 5 ) || ( s > 9 ) )\)

   ________________________________

2. What is the value of the following expressions:

   \((x - 5 != 5) && (x - 5 == 5)\)

   ________________________________

   \(! ( 1 == 1)\)

   ________________________________

   \((x - 5 != 5) || (x - 5 == 5)\)

   ________________________________

**Question 2 (25 points)**

Show the output of each of the following program segments:

```cpp
const int ten = 10;
int d;
int n = 45067;
do {
    d = n % ten;
cout << d;
n /= ten;
} while (n != 0);
```

```cpp
int x = 1, y = 2;
while (x < 3)
y /= ++x;
cout << "x = " << setw(3) << x << "  y = " << setw(3) << y << endl;
```

```cpp
int s = 0, k = 0;
while (k < 40)
if ((k % 3 == 0) && ( k % 5 == 0))
s += ++k;
cout << setw(4) << k << setw(4) << s << endl;
```

```cpp
#include <iostream>
#include <iomanip>
using namespace std;

int a = 4, b = 6, c = 2;
do {
    if ( b > a)
    { t = a;
a = b;
b = t; }
    if ( c > b)
    { t = b;
b = c;
c = t; }
} while (( b > a) || ( c > b));
cout << "a = " << setw(3) << a << endl;
cout << "b = " << setw(3) << b << endl;
cout << "c = " << setw(3) << c << endl;
```
**Question 3 (20 points)**
A Prime number is a positive integer number greater than 1 which is only divisible by itself (and eventually by 1). The first prime number is 2, and the next is 3, and so on.

The following C++ program takes a positive integer number greater than 1 and less than 100 and prompts the user whether the entered number is prime or nonprime. There are some missings (represented by dots) in the given program. Complete these missings such that the program could be compiled and run correctly. The program does not accept any integer number outside the given range (greater than 1 and less than 100).

**The Program**

```cpp
#include <iostream>
#include <iomanip>
using namespace std;

void main ()
{
    int num, c;
    bool prime;
    do
    {
        cout << "Enter a positive integer greater than 1 and less than 100: " << endl;
        cin >> num;
    } while (…………………………………………..);

    ......................;
    ......................;

    while ( ..................................................)
    {
        if ( .........................)
            ......................;
        else
            ......................;

        if ( .........................)
            cout << "The number " << setw(4) << num << "is Prime" << endl;
        else
            cout << "The number " << setw(4) << num << "is Nonprime" << endl;
    }
}
```
Question 4 (20 points)

Write a program that uses nested loops to produce the following output:

```
1 1 1 1 1 1 1 1
0 1 1 1 1 1 1 1
0 0 1 1 1 1 1 1
0 0 0 1 1 1 1 1
0 0 0 0 1 1 1 1
0 0 0 0 0 1 1 1
0 0 0 0 0 0 1 1
0 0 0 0 0 0 0 1
```
**Question 5 (25 points)**

Write a C++ program that takes 24 readings of temperature (each reading is between -10 and 55), computes and prints out the average temperature (avgTemp), maximum temperature (maxTemp) and minimum temperature (minTemp) of the day. The program should also compute and print out the number of temperature readings (numTemp) that exceed 35. **Enforce validation on the user input and use appropriate format for the output.** The average temperature should be rounded to the nearest hundredth.

**The Program**

```cpp
// your code goes here...
```

---

5
Good Luck
